

HABITHUB

A multi-generational habit-building and goal-tracking app that combines gamification, family involvement, and social accountability in one transformative hub.

HabitHub

App Idea for Prototype

A novel app that creates a gamified way to create new and healthy habits using collaborative experiences, gamification, personalization and a sense of competitiveness. HabitHub is designed to best benefit children to get into new habits and routines in a positive fun way, this also applies with adults as well. Families can manage their households and parents can create tasks for other members. Data is easily shown through visuals like graphs and some simple wording. HabitHub is built to strengthen every individual building positive habits and routines which in hand creates a stronger community.

Motto: *Habits made simple, together.*

How is it Novel?

HabitHub is a novel app due to the fact we are creating an app that grows with the consumer. One of our goals for our app is for it to be used for a child throughout their childhood and then continue using it in their adult life. They can then use that to manage their kids' activities and routine. Through our brainstorming we believed a generational app that gets passed down would be an app that could benefit consumers throughout all points in their life.

What is The Transformative Experience?

HabitHub delivers strong gamification to help children enjoy doing certain tasks kids tend to find uninteresting or tedious by offering rewards, competitiveness and motivation through our gamification methods. Adults benefit from this as well as they can see their progress over time to see if there are inconsistencies or inconsistencies. This helps build friends and family relationships using gamification.

Background Research

Competitor Apps:

- Habitica – gamified habit tracker, but primarily for adults; lacks child-friendly design and family integration.
- HabitNow / Loop Habit Tracker – effective for adults, but offers only solo tracking, not social or family-centered features.
- Brili Routines – targeted at children but focused on task lists without meaningful parent participation or integration with adult habit tracking.

Inspiration Apps:

- Talking Tom – inspiration for interactive, child-friendly characters that make kids want to engage daily.
- Snapchat / Duolingo – inspiration for streak tracking, light social interaction, and making progress sharing fun.
- Fitbit Groups – inspiration for social accountability through group challenges and leaderboards.

HabitHub is inspired by these apps but stands out by combining family-based gamification for kids with peer-based accountability for adults, creating a flexible ecosystem that adapts to different life stages.

PACT FrameWork

People:

- Children (ages 6–12) – encouraged to build positive routines with parent involvement.
- Parents – assign and track children’s habits while modeling their own.
- Adults (16+) – use the app independently with friends, peers, or colleagues for accountability and goal achievement.

Activities:

- Children complete daily tasks via interactive characters and earn rewards.
- Parents assign habits and track progress, participating alongside children.
- Adults set personal goals, join group challenges, and track progress socially.

Context:

- Family use at home for routines (e.g., brushing teeth, chores, homework).
- Individual or group use for adult goals (fitness, studying, productivity).
- Social use with friends through shared hubs, challenges, and leaderboards.

Technologies:

- Figma
- AI tools (ChatGTP)

Value Proposition

HabitHub is a place where children can start new healthy routines/habits in a positive and fun way through gamification. Our app delivers rewards, prizes, medals and more to keep children engaged and wanting more. By a child completing a task or a routine they will receive rewards which creates a positive connection to that routine or habit. We build strong and positive habits for children while they are young to further benefit them in the future. Adults and parents also can chime into our app for personal gain or to view their child's progression through visualized data. HabitHub is the future for building positive habits and routines.

Requirements Gathering

Purpose or Objectives of Requirements Gathering User Study

- Identify child/parent/adult habit behaviors
- Identify preferred visualization methods
- Understand gamification expectations
- Understand privacy concerns
- Identify notification preferences
- Evaluate UI simplicity expectations

Choice of User Study and User Sample

Semi-structured dual-perspective interviews (children, parents, adults)

Draft of The User Study Survey or Interview

Children (ages 6-12)

The structure of these questions are designed to assess the amount of tasks a child has on a daily basis and a deep dive into their creativity and preferences. We decided to shape these questions in a way where we see their imagination in their “perfect” game world. This will help us gamify HabitHub so it can meet the children's preferences. It is focussed less on the functionality of the app but more on the UI design portion.

1. What are some things you do everyday, for example do you make your bed everyday, or brush your teeth every morning and night.
2. Out of the list you just gave me, what do you find the most challenging to do and what do you find the most challenging to remember to do
3. Do you have any tasks that includes the help of others (relatives, family, friends)
4. When you finish your tasks do you get rewarded, and what do you get rewarded with (time on the game, time with toys, stickers, etc)
5. What is your favourite reward you get and why is it your favourite
6. If your tasks could be turned into a video game would that make it more fun for you

7. If the game (app) had a character (yourself) and it would get stronger the more tasks you do would you enjoy that
8. What are some ideas you think you would add to this game

Parents

The structure of these interview questions is designed to see a parents true input on their child's goals and tasks whilst understanding their core ideas on the functionality of the app, such as how they would like to view their data, the app structure and privacy.

1. What are the most important tasks/routines your child does on a daily basis and what habits would you like them to start or improve on.
2. In terms of data, how would you like to view it? Through graphs and visuals or would you like written summaries.
3. What are your main concerns with your child's routines/tasks
4. If possible how would you feel if you could control your child's screen time based on the amount of tasks they have done
5. Is there any additional features you think would be good to add that would benefit you
6. How often would you like to be notified? (notify on every task they have completed or just once they have finished for the day)
7. Would you be okay for gamification in terms of keeping your child engaged and motivated.
8. Would you be okay for to set up goal trackers for your children or give them some freedom to add their own goals as well
9. In terms of your kids' habits, what are some features you'd like to have to help shift their habits into a healthy and positive way.

Adults

Questions are designed for adult personal preference in terms of how they would use the app and for social purposes

1. What are your daily goals and habits
2. What are the goals you find you need most help with to stay consistent
3. What are some habits you are trying to build
4. What motivates you to stay consistent? Would sharing your habits with others to see your progress help?
5. What are your "rewards" when you finish a task or habit? Would rewards such as streaks, badges and visuals make you feel rewarded
6. How often would you like reminders/notifications on tasks and habits you have not done or that are coming up (if you have a specific time you do something)
7. Would you like to share you progress and data with others like friends and family
8. How would you like to see your data; through graphs and visuals or summaries

Data Visualization and Analysis

Sample Size: We have interviewed a total of 17 participants ranging from children to adults.

Data will be collected and organized into a word file summarizing key topics (point form) discussed during interviews and also key works will be taken down this way we can see what our participants are most intrigued in.

We will visualize our data through graphs like bar charts or pie charts. We would use this to compare which features outshines others to ultimately choose how we are going to design our app. For example, we will use a pie chart for certain gamification features. The feature that has the most backing will be the feature we decide to implement in our project. We can also use word clouds to group the keywords we find our participants use. For example, we will use word clouds to see the most common keywords spanned across our target market to see what they all have in common and emphasize on.

Once we have gathered and organized the data we will then proceed to determine and design our app based on the elements that were most desired and talked about in our interviews. For example if the participants all enjoyed the idea of a points reward system we will implement that into our app.

Insights from Results

Key points discovered amongst participants

Children

- Intrigued with visual rewards, screen time extension, and social interaction between family and friends (fun way to socialize and a sense of competitive ness)
- Habits are still developing so using the app to suggest or help create healthy habits for children
- Children find the gamification very exciting and are very interested
- Most children wanted character customization, and point rewards

Parents

- The majority of parents were enthusiastic about the app as it is a way to get their kids off certain games and focussed on our app instead as it would create healthier habits.
- Simple and easy to read design in terms of data. They would like mainly visual data and some short summaries in terms of assessing data.
- Privacy concerns in terms of sharing a child's name and other information. Should only be shown to other family members (have usernames instead of real names for friends)
- Want notifications on all habits/tasks done by their kid

Adults

- Enjoyed the idea of a point system and badge rewards
- Self improvement and consistency were big in conversations with participants
- Visual presentation in terms of progress and data instead of summaries
- Simple and easy to navigate UI
- Adjustable notifications (some would just like to have reminders at the end of the day)

With the data we have collected the users' responses seemed very intrigued with our app. They all believed this would be a good idea and would benefit them and their family. This changes the requirements for our app a little bit as originally we had a standard gamification method (points) but now we would like to gamify our app more as it makes it more engaging and social for all target markets.

Synthesis of Requirements Gathering and Generation

Personas and Scenarios

Persona 1:

Name : Nayra

Age : 7

Role : Child

Relation : Child from Jayden's work force

Nayra is a 7 year old child who loves play and art. At such a young age she is extremely gifted with artistic skills. Through her passion and love for drawing she tends to get carried away a lot as she gets into a deep dive in her artwork. Using HabitHub could be beneficial for her as Nayra's parents could send notification/reminders to finish a chore or a routine when she forgets or in general have a set schedule of reminders when routines/habits are meant to be done. She loves designing so when character progress and customization was brought up she was very interested and happy.

Goals

- Remember to finish all tasks before the day is done
- Wants to explore the customization material
- Wants to be able to get reminders for tasks

Scenario:

After a playful and fun day at school, Nayra goes home and starts to draw. She forgets to empty out her backpack and put her lunchbox in the kitchen. She receives a notification on her ipad from dad reminding her to empty out her bag and put her lunchbox in the sink. This helps Nayra build that habit to clean out her bag when she gets home. After doing her tasks she opens up HabitHub to look at all the other tasks/routines she has left for the day. She also decides to customize her avatar.

Personal 2:

Name: Davey Nat

Role: Parent (1 boy aged 11)

Relation: Former coach and mentor for Jayden

Summary: Davey is a strong individual who has a son who loves to play video games. He has expressed that his son sometimes is on it for too long and cannot get him off the game to help him out with chores around the house. He believes HabitHub can benefit him and his son as his son is already attached to his phone so he will see the notifications and reminders to do a task, plus get rewarded through gamification with it.

Goals

- Assign and create tasks to his son
- View progress through visuals with some written portions
- Focussing on structure and consistency for his son

Scenario:

Davey's son loves to play video games and as a result of that his son often forgets to do his chores or routines. He wants his son to finish his chores and routines before playing so that his son can enjoy the game without having to worry about doing anything while playing. Davey opens up HabitHub and creates a few tasks for his son to do like put the laundry away, and clean your room. He posts it and his son gets notified. His son sees the reminder and starts to complete all his tasks. At night Davey reviews his sons progress through data and is very happy his son is in a positive trend

Persona 3

Name: Nandani Dhaul

Age: 22

Role: Adult

Relation: Coworker

Scenario:

After working a morning shift Nandani goes to the gym before going to her classes for the day. After she goes to the gym she opens HabitHub to see what stores she will need to go to for her groceries for the week. As she goes store to store she checks them off one by one and then proceeds to go off to her classes for the day. After each class ends she checks them off on HabitHub. Nandani then gets home and cleans up her apartment. At the end of the day she lays in bed looking at HabitHub realizing all the points she has earned for today and decides to go to the point shop to buy some items for her character. Nandani believes HabitHub is a motivator for her to stay productive, consistent and more importantly organized with such a busy schedule.

Requirements Generation

- Data to be visualized mainly with some summaries
- Over-gamification would not hurt
- Simplistic UI for easy access and navigation
- Create, edit, delete tasks/routines
- Interactive dashboard
- Points based on certain tasks (parents can assess points)
- Send reminders and notifications based on users preference
- Include a customizable character
- Daily point shop to encourage rare items (items reset every 24 hours)
- Have lots of cosmetics for your character
- Display rewards and streaks for friends and family to see
- Parent to have access easily to all children individually or as a group
- Strict privacy standard for families
- Social Tab to see how friends and family are doing
- Have multiple hub types such as friends family and teams
- Parents should have full control over child accounts

Synthesis of Requirements Gathering and Generation

High Priority

- Create, edit, and delete tasks/routines (all target markets)
- Visual dashboards
- Simplistic UI
- Customizable characters
- Point system
- Daily point shop
- Reminders and notifications
- Parent dashboard
- Privacy standards
- Easy to read data
- Social tab
- Leaderboard

Medium Priority

- Multiple hub types
- Weekly report
- Monthly report
- Offline functionality
- Trade items from point shop
- Sound effects and animations

Low Priority

- Seasonal items in point shop
- Motivational quotes for adults
- Group challenged based on family structure
- AI integration on habit suggestions

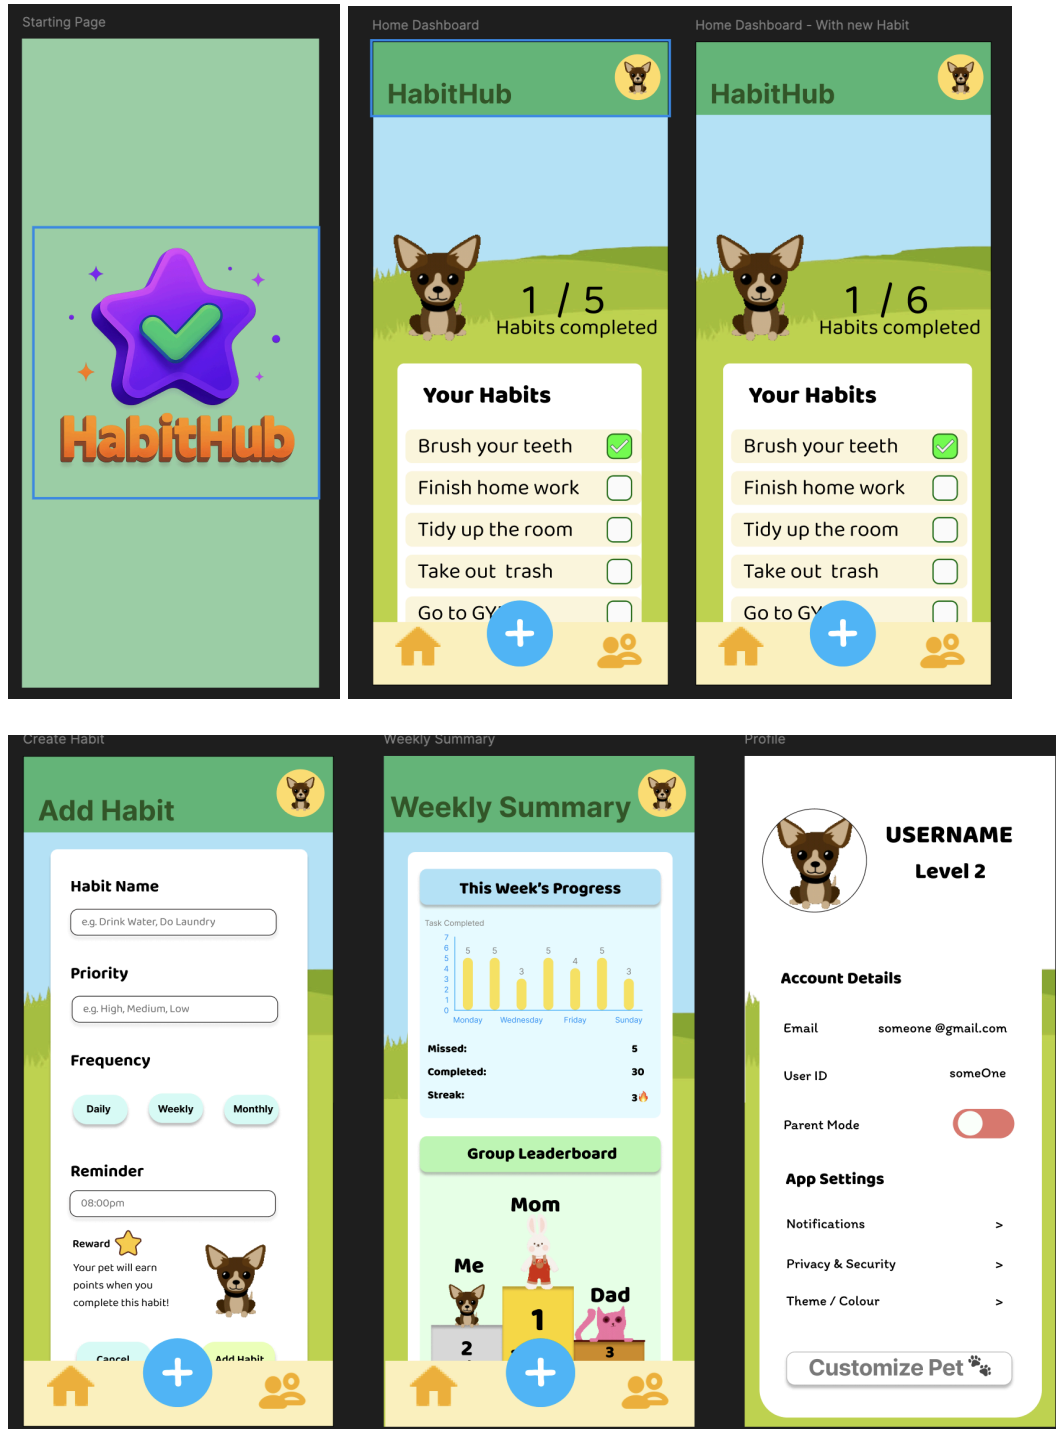

Design:

For visual design our goal was to keep the app layout as intuitive as possible. We used a card-based layout to visually separate individual habits, making it easier for users to quickly scan and understand their daily tasks. A bottom navigation, to provide fast and predictable access to the main pages of the app. And we also integrated gamified feedback and playful visual cues to encourage habit completion and offer positive reinforcement, helping users stay engaged and motivated throughout their journey.

We also made sure to pick a color palette that wasn't too loud or monotone, as we wanted the app to feel fun but not overstimulating. We chose to have soft corners of our cards, contrasting colors for when buttons toggle. We also made sure to space out the elements and use font style and size that are easy to read. And lastly we included some cute and exciting icons and gifs to continue embracing the soothing fun vibe of the app.

During the development stage, we first got started with low fidelity wireframes, establishing layouts and overall structure. Once the basic flow was completed we focused on modifying frames with higher priority, for example home dashboard → creating habit → weekly summary → profile. Along while developing the frames we also created components to ensure consistency throughout the project. Lastly to make the prototype interactive we used the interactions, variants, flow and various other plugins and Figma features.

ScreenShots of Screens

Designer Based Prototype Evaluation

Users begin their experience on the animated start screen, which smoothly transitions into the Home Dashboard. On this screen, they can immediately review their daily tasks, check off completed habits, and view an at-a-glance progress summary for the day. From here, users can move through the app in two ways: by using the bottom navigation bar or by using gesture-based navigation. Swiping left takes the user directly to the Add Habit screen, where they can create new tasks by entering a habit name, defining a category, and choosing a frequency. After adding a habit, users can swipe right to return to the Home Dashboard or swipe left again to continue to the Weekly Summary and Social Dashboard. On this page, they can explore insights about their weekly performance, track streaks, and view their placement on the social leaderboard.

Users can also choose to navigate using the persistent nav bar, which provides consistent access to all major sections of the app. With one more left swipe from the Weekly Summary screen, users reach the Profile Page, where they can update account details, modify app settings, and customize their virtual pet. This combination of gesture-based navigation and traditional UI components ensures that users can move through the app smoothly while maintaining a sense of continuity and control.

User-based Prototype Evaluation (User Study 2)

Purpose or Objectives for Purpose Evaluation User Study

The purpose of the prototype evaluation was to observe how real users interact with the functional Figma prototype and identify any usability issues or gaps in navigation, clarity, and engagement. We aimed to gather feedback to improve the interface before finalizing the design.

Objectives

- Evaluate whether users can navigate between screens without confusion
- Test if the habit-creation flow is understandable for all age groups
- Observe how quickly users recognize icons, buttons, and layout structure
- Determine whether gamification elements (points, rewards, streaks) increase engagement
- Assess clarity of the Home Dashboard and Weekly Summary
- Capture reactions to avatar customization
- Identify accessibility or readability issues in spacing, font sizes, and colours

Choice of user study and user sample

For Prototype Evaluation, we conducted a task-based usability test supported by semi-structured interviews. This method allowed users to interact naturally with the prototype while we asked follow-up questions based on their behaviour.

User Sample (Dual Perspective):

We targeted three primary user groups because each interacts with HabitHub differently:

Children (ages 6–12)

- To evaluate UI simplicity, navigation clarity, and gamification appeal

Parents

- To evaluate data visibility, and oversight tools

Adults (16+)

- To evaluate habit-tracking flow, readability, and motivation-based elements

We used a dual-perspective approach because HabitHub serves multiple generations, and each group provides unique preferences about usability and values.

Draft of The User Study Survey or Interview

- Child interview script
- Parent interview script
- Adult interview script

Data Visualization and Analysis

Sample Size: 4:

1 child

2 parents

1 adult

Average Ratings:

- Ease of navigation: **4 / 5**
- Clarity of icons: **4 / 5**
- Creating a habit: **2 / 5**
- Satisfaction with gamification: **3 / 5**
- Visual clarity/readability: **4.5/ 5**

Median values remained consistent (4–5 range), showing strong overall usability.

Qualitative

- Children focused heavily on gamification aspects and visuals
- Parents focused on clarity of data
- Adults focused on convenience, and task editing
- All users reacted positively to avatar customization

The combination of quantitative and qualitative data showed that the core concept works well, but clarity and accessibility improvements were needed.

Insights from Results

Children

- Avatar customization is extremely important for engagement
- Points and streak rewards strongly motivate use
- Wanted brighter colours and more animations

Parents

- Prefer visual data summaries with optional short text summaries
- Strong desire for notifications after every completed task
- Privacy concerns about child names shared outside the family

Adults

- Prefer visual dashboards over text summaries
- Motivated by streaks, badges, and social leaderboards
- Need adjustable notifications

Changes to the design based on Prototype Evaluation

Changes Needed (Based on Feedback)

- Add a visible “+ Add Habit” button
- Expand avatar customization
- Add clearer icons and improve spacing for readability
- Increase size and contrast of toggle buttons
- Add streak badges to weekly summary
- Adjust colours to improve accessibility for younger children

Changes Completed in This Iteration

- Added visible “Add Habit” button
- Improved bottom navigation
- Improved icon clarity and spacing
- Added streak badges and animations
- Changed colour palette for accessibility
- Improved layout of Weekly Summary

Changes That Are Major and Cannot Be Completed in This Iteration

- Full overhaul of avatar customization
- parental privacy controls
- Multiple hub types
- Point shop and trading systems
- Monthly and weekly report generator

These features require significant development time, additional UI architecture, or complex data logic beyond the prototype stage.

Conclusion

Prototype Evaluation helped and benefitted HabitHub create the needs for children, parents and adults through gamification, simplistic UI design and clear visualized data. Feedback from participants proved that the grounding of HabitHub is strong and an amazing idea especially with how tech is emerging in today's world while still giving us areas to look back on and refine such as parental controls and character customization. Once the improvements were made after the evaluation HabitHub in totality became a more consistent app with better UI design.

HabitHub is showing strong potential and growth in being the first multi-generational habit tracking app for children, parents and adults that supports healthy routines and habits while giving a sleek design for UI with gamification to keep everyone engaged.

AI Use Section

AI Tool Name	Version, Account Type	Specific feature for which the AI tool was used
ChatGTP	5.1	Helping gathering survey questions for Prototype Evaluations
ChatGTP	Mix of 5 and lower versions when ran out of limit	Guided me on how to create elements and to videos that could help with it. Also guided me on how to create the layout and structure i had in mind

Value Addition:

We used AI to help gather some questions to ask users when testing our prototype. The questions generated by AI were base questions and we build on top of them to form about 4-5 questions per target market and create more specific questions that meet our needs.

Appendix:

Prompt: For my App that I am currently building called HabitHub what are some prototype survey questions to ask 3 groups (children, parents, and adults). here is a brief explanation of our app: A novel app that creates a gamified way to create new and healthy habits using collaborative experiences, gamification, personalization and a sense of competitiveness. HabitHub is designed to best benefit children to get into new habits our routines in a positive fun way, this also applies with adults as well. Families can manage their households and parents can create tasks for other members. Data is easily shown through visuals like graphs and some simple wording. HabitHub is built to strengthen every individual building positive habits and routines which in hand creates a stronger community. what are some survey question to ask these 3 groups in terms of our ui design, navigation and gamification and parental controls and data visualization

Response: Here are **clear, practical prototype survey questions for each group** (Children, Parents, Adults), focused on **UI design, navigation, gamification, parental controls, and data visualization**. These work perfectly for evaluating your HabitHub prototype.

We also used AI to help with layout and structure of the app. It also gave guidance on how to create certain elements:

Prompt: how to add interactive chalk marks?

Response:

1. Add two icons

- `check_off` (empty circle, square, etc.)
- `check_on` (filled check mark)

Place them in the same spot.

2. Put them inside a Frame

Select both → **Right Click** → **Frame Selection**

Name it: `CheckToggle`

3. Create two variants

1. Select the frame → Right panel → **Add Variant**
2. You now have:
 - **Variant 1 (unchecked)**
 - **Variant 2 (checked)**

Replace the icon inside each variant.

4. Add interaction

Go to **Prototype** tab:

In Variant 1

→ Click the icon → Click the blue + arrow
→ Set to:

- **On Click**
- **Change To: Variant 2**
- **Smart Animate**

Then in Variant 2

→ Do the same but switch back to Variant 1.

🎉 Now clicking the checkmark toggles between checked/unchecked.

”

Value addition:

With the help of AI's guidance I was able to create the check box. I modified the visual of the check box and used it to keep track of tasks completed.

1. CHILDREN (Ages ~7–13)

Keep wording simple and visual-based.

UI Design & Navigation

- Was the app easy for you to understand the first time you used it?
- Which screen was the easiest to use? Why?
- Which screen was confusing or hard to use?
- Were the buttons and icons easy to find?
- Did you know what to do next on each screen?

Gamification

- Did you like the rewards or points system?
- Did earning rewards make you want to finish your tasks?
- Which game-like feature did you like the most? (Badges, streaks, characters, etc.)
- Did anything feel boring or not fun?

Tasks & Habit Building

- Was it easy to see what tasks you had to do for the day?
- Would you use this app to help you finish your chores or routines?
- Did you understand your progress (like points, streaks, or levels)?

Visuals

- Did you like the colors and pictures?
- Was anything too bright, too small, or hard to read?

2. PARENTS

UI Design & Navigation

- How clear were the menus and navigation?
- Could you quickly find where to add or edit tasks for your children?
- Did any page feel cluttered or confusing?

Parental Controls

- Did the parental control options feel easy to understand and use?
- Did you feel you had enough control over your child's tasks and routines?
- Would you want notifications? If so, which types (task done, streak broken, reward earned)?
- Would you prefer approval options for rewards or tasks?

Gamification

- How appropriate did you find the gamified elements for children?
- Do you feel the app encourages positive behaviour?
- Is the reward system balanced (not too much, not too distracting)?

Data Visualization

- Were the charts/graphs easy to read and understand?
- Was the progress information helpful for understanding habits?
- Would you want weekly/monthly summaries?
- What visual information is missing?

Security & Privacy

- Did you feel your family's data would be safe using this app?
 - Would you prefer an additional privacy setting for children?
-

3. ADULT USERS (Using for Personal Habits)

UI Design & Navigation

- Did the UI feel clean and easy to navigate?
- Were the steps to create habits clear?
- Did anything take too many taps/clicks?

Gamification

- Do rewards or streaks motivate you personally?
- Which gamification feature felt most useful for adult users?
- Did anything feel too "childish" or not adult-friendly?
- Would you want competitive features (leaderboards, weekly challenges)?

Data Visualization

- Was the progress graph easy to understand at a glance?
- Did the app give you enough insight into your habits?
- What type of data would help you stay motivated (trend lines, reminders, stats)?

Personalization

- Was it easy to personalize your habit list?
 - What customization options would make the app more useful?
-

BONUS: Questions to Ask All Groups (General Prototype Feedback)

- What was the best part of the app?
 - What was the most confusing part?
 - What would you change or improve?
 - Would you use this app every day? Why or why not?
 - How likely are you to recommend this app to others?
-

If you want, I can also create **Google Form versions of these, Like scale questions (1–5), interview questions, or a script for testing your prototype live.**

Prototype Evaluation Surveys

Children (Ages 6–12)

Gathering a better understanding of how engaging and gamified and how good the navigation process is in HabitHub.

- On a scale of 1–5, how easy was it to understand look around the app (navigating)
- On a scale of 1–5, how easy was it to move between screens (Home, Add Habit, Weekly Summary, Profile)?
- Did you like the points, streaks, and rewards shown in the app?
- Did you find the app interesting? Did it make you want to do more
- What is one thing you would change to make the app more fun or easier for you to use?

Parents

Gathering intel on parental features and data visualization and navigation

- On a scale of 1–5, how clear was your child’s progress on the Home Dashboard and Weekly Summary?
- On a scale of 1–5, how easy was it to find and understand the app
- Do you feel the visual graphs and simple summaries are enough for you to understand your child’s habits?
- Do you think the points, rewards, and streaks shown in the prototype would help motivate your child to complete tasks?
- What is one feature or change that would make HabitHub more useful for you as a parent?

Adults

Gathering a better understanding of how engaging and gamified and how good the navigation process is in HabitHub.

- On a scale of 1–5, how easy was it to create a habit using the “Add Habit” screen?
- On a scale of 1–5, how helpful was the Weekly Summary screen for understanding your progress?
- Did the points, streaks, and rewards make you feel more motivated to complete tasks?
- Was the navigation simple and clear to you?
- What is one thing you would change or add to make HabitHub more useful or motivating for you?

Work Date/Hours Logs

Dhwani Patel

300376445

Date	Number of Hours	Description of Work Done
Sept 24th	3	Brainstorming and proposing project ideas
Sept 25th	2	Messed around with Figma and followed a couple short tutorials to get familiarized
Oct 1st	1	Drafted and prepared project proposal
Oct 5th	0.5	Finalized proposal and submitted it
Oct 14th	1.5	Got started on making the wireframe draft for the project app on Figma

Oct 16th	0.5	Interviewed 2 people for the requirements gathering
Oct 20th	1	Interviewed 3 people for the requirements gathering
Oct 22nd	1	Continued working on the wireframe and picking a color theme and aesthetics options
Oct 26th	0.5	Created a brief checklist of user needs from the user requirement gathering
Oct 27th	1	Made minor adjustments in the wireframe to have better structure and layout
Oct 30th	2	Created components in Figma for various elements
Oct 31st	2	Drafted a few ideas for dashboard page
Nov 3rd	1	Brainstormed reward mechanism
Nov 5th	2	Built first draft of dashboard for prototype
Nov 9th	3	Built the draft of login and sign-up page, also made minor changes to the dashboard
Nov 12th	2	Drafted Habit / task page
Nov 13th	1	Drafted calendar and list view pages for habit / tasks
Nov 16	1	Created a Register page Wireframe
Nov 17	5	Created the Home dashboard, made task cards, implemented check logic and

		created component variants, made the nav bar.
Nov 22	5	Worked on trying to implement a progress ring and learnt to use and manipulate variables. Transferred project to figma account with college id to use interactions and variables.
Nov 23	4	Added a virtual pet. Made the variables work properly. Tried to create animation but i was still struggling a bit
Nov 25	5	Learned about lottie and tried to make animations to implement in the project. Watched youtube videos to implement bar charts
Nov 26	9	Finished modifying all frames except creating habit, implementing the weekly progress and leadership board along with streaks. Also created flows and interactions.
Nov 27	6	Completed modifying the create habit page. Added final touches and checked all interactions.

Jayden Prasad

300367841

Date	Number of Hours	Description of work done
Sept 24th 2025	2	Initial Brainstorming for project ideas , and written short description of each idea
Sept 30th 2025	1	Created git repo and read me file
Oct 3rd	1	Initial testing and working around of figma seeing what it is and what it offers
October 8th	1	Requirements gathering creating survey questions
Oct 12th	0.5	Interviewed first person
October 13th	1	Interviewed 3 participants for requirements gathering
October 19th	1.5	Played around in the figma basics to get a better understanding on how to build a nice UI
Oct 20th	0.5	Interviewed 2 people for requirements gathering
Oct 21st	1	First attempt at creating home page of Habit Hub
Oct 22nd	1.5	Interviewed 4 participants for requirements gathering
Oct 22nd	0.5	Started working on requirement gathering paper (

Nov 23rd	0.5	Continuation of final report document
Nov 26th	2	Wireframe designing for login page and touch ups for home dashboard
Nov 27	1.5	Finalizing Final Report

Checklist (CHECK EACH ENTRY TO VERIFY THAT IT HAS BEEN DONE)

-
- ☒ Title Page on this report: Make sure all the details required in the title page is filled. Also, ensure that you provide overall percentage contributions of each member in the group. The total should add up to 100% and each student's percentage contribution must reflect the work completed throughout the project.

 - ☒ Final Report GitHub Repository Check-In: The final report must be checked into GitHub Repository under DocumentsAndReports. All reports and documents must be in the main branch of the repo.

 - ☒ Final Defense and Demo Preparation: The final defense and demo presentation should be no more than 5 minutes. This includes a very brief introduction to what your app does (keep slides only as backup if questions are posed), and DEMO of your project. It is your discretion to demo parts you want to showcase but I may ask you to demo other parts not presented that you have completed based on your report. Every person in the team should showcase work they have done in the project. Questions will be posed during your presentation. **YOU MUST BE PRESENT AT THE FINAL PRESENTATION AND DEMO IN ORDER TO GET A GRADE IN THE PROJECT.** See slides on blackboard for details

 - ☒ Completed Figma prototype: Updates to the ReadMe File stating clear project/product description, and a section indicating installation instruction. How can I use the repository files, to see a demo of your product? Installation instructions can either be in the README file initially created or as a separate file in the GitHub repository and in the appendix of the final report

 - ☒ Final Report Blackboard Submission: Completed Report submitted on Blackboard by the Team Lead
-
